MSDA Project II Workbook 1

Team 12

Jean Doe, John Doe, Mary Roe, Joe

Roe Mmmmmm dd, yyyy

4. Model Development

4.1 Model Proposals

Propose models to solve targeted problems in detailed terms of concepts, features, algorithms, etc.

4.2 Model Supports

Describe the platform, environment and tools to support the development and execution of each model; provide diagrams of architecture, components, data flows, etc.

4.3 Model Comparison and Justification

Compare models regarding function and non-functional characteristics including strengths and targeted problems, approaches, data types, limitations; provide justification for each model.

4.4 Model Evaluation Methods

Present evaluation methods and metrics for each model, e.g., accuracy, loss, ROC/AOC, MSRE, etc.

4.5 Model Validation and Evaluation Results

Evaluate models based on selected model evaluation methods/metrics; compare among different models; validate results with samples.

5. Data Analytics System

5.1 System Requirements Analysis

Identify system boundary, actors and use cases; describe high-level data analytics and machine learning functions and capabilities.

5.2 System Design

Design the system architecture and infrastructure with AI-powered function components; design the integration with supporting platforms, frameworks and a cloud environment; design the data management solution and database; design user interface and data visualization.

5.3 Intelligent Solution

Present the developed AI and machine learning solutions for each targeted problem, including integrated solutions, ensembled, developed and applied machine learning models; describe required project input datasets, expected outputs, supporting system contexts, and solution APIs.

5.4 System Supporting Environment

Present the information and features of system supporting environment, including technologies, platforms, frameworks, etc.
